

New Process Equipment sales and Design service

Axion Consulting is now able to offer plant and equipment for the primary processing of plastic waste materials.

Axion's Machinery Sales team can offer tailored designs of first-stage process plants to deal with a wide range of different types of plastic wastes.

Axion is acting as sales agent for several leading equipment suppliers from across Europe and our engineers are able to combine individual items of machinery into simple process plants to satisfy a wide range of difficult waste challenges in the plastics sector.

If you have a sizeable waste plastics problem with a significant level of dirt, paper and label contamination, then you should contact our Machinery Sales team to discuss the application. We can then rapidly assess the size and scope of the problem and offer a process solution based on the most appropriate equipment for your application.

As part of this service, we also offer to assist with budget stage project evaluation to compare the capital expenditure with the financial benefits of the proposed process solution.

Catalogue of equipment includes:

- *Dry Cleaning Technology*
- *Size reduction equipment*
- *A choice of wet washing systems*
- *Storage and handling equipment*
- *Conveying systems*

Contact us if you have a regular, large volume of dirty plastic waste and you are considering alternative ways to dispose of the material. Such items as mixed post-consumer packaging, industrial food wraps and agricultural films can be handled to increase income and reduce disposal costs.

Who are we?

Axion Consulting develops and operates innovative processing solutions for recycling waste materials. This division was created in response to increased demand from a wide range of clients within the recycling and process industries for practical development of new processing and collection methods. Alongside this, we have become UK agents for a number of leading process equipment suppliers.

Based in Bramhall, the 16 strong consultancy team comprises highly-qualified and experienced Chemical Engineers and Project Managers who work with clients to develop novel processes and innovative collection methods for a variety of industrial and commercial markets. Drawing on first-hand experience of waste plastics processing, our team has the expertise to help you to identify processing problems and areas for potential efficiency improvements. We will provide you with bespoke solutions and help you to assess the benefits for your business.

Axion Consulting - *Innovative Resource Recovery*
